

Nobody fails at remembering: the attempt breaks when memory has to become a query, and again when the query misses

All 800 retrieval records hold usable context. What they lack is an identifier the search box accepts, and a way back after the first attempt returns nothing.

800 of 840

rows describe an attempt to find a specific photo the user believes exists

594

name the identifier they lack: time precision 199, a name 149, a keyword 64

322

state outright that they cannot turn what they remember into a keyword (40% of records)

55

attempts resolve on the first try: 6.9% of all records

WHAT THEY HOLD, AND WHAT THEY LACK

Records may hold several clues, so columns do not sum to 800.

HOLDS

LACKS

WHICH PHOTOS THEY ARE HUNTING FOR

family / person 183 · document / screenshot 161 · event / social 134 · medical 121 · travel / place 121
Personal and document photos dominate: the two classes together are 344 of 800 rows.

HOW THE 800 ATTEMPTS END

Mutually exclusive: every record states one outcome.

WHERE THE ATTEMPTS REACH, STAGE BY STAGE

REMEMBER 800

holds context

EXPRESS 566

turns it into a query

MATCH 120

describes what came back

RECOGNIZE 120

judges the candidates

RECOVER 661

tries again after a miss

Only 120 records say anything about the result set, so the corpus cannot tell us whether the wanted photo was there. 661 describe a second attempt: recovery, not the first query, is where most of this corpus lives.
